Description

The R type is a medium pressure regulator for gas according with EN 334. It is available also with a safety shut-off valve which blocks gas flow in the event of a spike or drop in the outlet pressure, in accordance with EN 14382. This device is suitable for supplying gas at stable pressure to all the devices downstream and to protect them against excess of pressure.

Features

R series pressure regulators are direct-acting spring-loaded regulator type, controlled by a diaphragm and spring. The balanced valve design ensures a constant pressure setting when upstream pressure varies.

RS version is an R regulator with an integrated safety shut off device against abnormal outlet pressure. Shut off valve system is independent from regulating device, to assure an high level of safety.

Regulators are available with inlet/outlet connections from DN25 (1") to DN50 (2").

Regulators are manufactured in three different versions in relation with outlet pressure: LP (outlet 15-160 mbar), MP (outlet 150-400 mbar) and HP (outlet 400-4000mbar). In any version components are optimized to achieve the best performances. Maximum inlet pressure is equal to 10 bar for version LP and MP; 12.5 bar for version HP.

The body of regulators are made of spheroidal graphite cast iron and covers are made of aluminum cast alloys for suitable strength with pressure.

Regulators are equipped with adjustable springs, so that outlet pressure, over pressure and under pressure can be set on site in a very precise way.

Regulators are equipped with an internal pulse line. An additional external pulse line can be mounted to reach the best capacity performance.

Regulators have been designed to generate low pressure drop with high flow.

Sealings are made of NBR-based rubber. Regulators are suitable for use with non-aggressive gases included in the 1, 2 and 3 families (EN 437).

All components are designed to withstand any mechanical, chemical and thermal condition occurring during typical service. Effective impregnation and surface treatments have been used to improve mechanical sturdiness, sealing and resistance to corrosion of the components.

Technical specifications

Tab. 1

Connections	Gas threaded f/f ISO 7-1 from Rp1 to Rp2 Flanged PN16 – ISO 7005 DN25 - DN50 (on request) Gas threaded NPT ANSI-ASME B1.20 (on request) Flanged ANSI-ASA-ASME B16.5 class 150 (on request)
Ambient temperature	-20°C ... +60°C
Inlet pressure	0,5 - 10 bar for version LP-MP 0,5 - 12,5 bar for version HP
Design pressure	20 bar
Regulating class (EN334)	AG 5 / 10 depending on outlet pressure SG 20 for lock-up (+7.5mbar or +20% of set value, at least)
Installation	Horizontal or vertical pipeline.
Gas type	Natural gas, town gas, LPG (gaseous) of families 1,2,3 (EN437).
Materials in contact with gas	Spheroidal graphite cast iron, Aluminum, Brass, Steel, Anaerobic adhesive, Nitrile rubber (NBR), Fluoro elastomer (FPM)

* R Regulator (without safety shut-off valve)

Selection and installation notes

To choose a pressure regulator, it is necessary to consider: inlet pressure (Pu), outlet pressure (Pd) and flow rate (Q). Tables below give the maximum flow capacity in m³/h of Natural Gas at standard conditions of absolute pressure of 1.013 bar and 15°C temperature with AC 10% and external pulse.

Conversion to LPG capacity in kg/h = multiply by 1,2 Conversion to Azote capacity = multiply by 0,789.

For calculate the flow at various conditions of installation, you can use the formulas given in EN334 (simplified calculations):

- a) If the flow's behavior is sub-critical, that is if $(p_u - p_d) \leq 0,5 * (p_u + p_a)$:

$$Q_N = \frac{13,57}{\sqrt{d * (t_u + 273)}} * C_g * \sqrt{(p_d + p_a) * (p_u - p_d)}$$

- b) If the flow's behavior is critical, that is if $(p_u - p_d) > 0,5 * (p_u + p_a)$:

$$Q_N = \frac{13,57}{\sqrt{d * (t_u + 273)}} * C_g * \frac{p_u + p_a}{2}$$

Where:

- Q_N = gas flow rate in Normal condition (Nm³/h)
(Normal condition 0°C 1,013bar - 1 Nm³/h = 1.056 stm³/h)
- d = gas relative density (see Tab. 10)
- C_g = flow coefficient (see Tab. 4)
- p_u = gas pressure at the inlet of regulator, in bar (relative value)
- t_u = gas temperature at the inlet of regulator (°C)
- p_d = gas pressure at the outlet of regulator, in bar (relative value)
- p_a = ambient atmospheric pressure (bar - absolute value – 1,013 bar generally)

Tab. 10

Gas Type	$d = \frac{\rho_{GAS}}{\rho_{AIR}}$
Natural Gas	0,61-0,66
GPL	1,55-2,00
Aria	1,00

It is advisable that real flow rate is not higher than 90% of calculated flow (values in tables already consider a safety factor of about 10% and suitable flow speed at outlet).

After selection of regulator, it is necessary to consider that **internal impulse line** works until outlet flow velocity of 20 m/s, for speed calculation, you can use the formula:

Tab. 11

$$V = \frac{345,9 * Q * (1 - 0,002 * p_d)}{D^2 * (1 + p_d)}$$

- V = flow speed (m/s)
- Q = gas flow rate in standard condition (stm³/h)
- D = internal pipe diameter (mm – see Tab. 11)
- p_d = outlet pressure of regulator (bar)

Tubazione	D mm
1"	28
1 1/2"	41
2"	56
2 1/2"	67
3"	80
4"	106

If flow speed at outlet is higher than 20 m/s, **external impulse line** is necessary (fittings for external pulse are available upon request). Outlet flow speed higher than 150 m/s is inadvisable.

For correct sizing of outlet pipe, consider maximum flow velocity in Tab. 12.

Tab. 12

P_d (bar)	$V_{out max}$ (m/s)
$P_d \leq 0,04$	5
$0,04 < P_d \leq 0,5$	15
$0,5 < P_d \leq 5$	25

Other recommendations for a long service life:

- always install a **filter** upstream the regulator;
- install a relief valve to discharge pressure surge due to fast shut off downstream the regulator;
- if external impulse line is necessary, connect it at a distance of at least **4xDN** from the regulator in a straight part of pipe (see fig. 2).
- install shut-off valve downstream the regulator at a distance not less than **6xDN**, to have a sufficient volume inside pipe to compensate increasing pressure when valve closes.

Fig.2 – example of installation with other Elektrogas devices

****For higher outlet pressure contact our sales department.**

Example: RS4-125 LP.E regulator with integrated shut-off valve, connection Rp1"¹/₂, inlet max 12,5 bar, outlet 100-130 mbar.

Standards and approvals

The regulators are designed and manufactured on the basis of norm EN 334 (Gas pressure regulators for inlet pressures up to 100 bar) and EN 14382 (Gas safety shut-off devices for inlet pressures up to 100 bar).

Quality Management System is certified according to UNI EN ISO 9001.

The information in this document contains general descriptions of technical options available and based on current specifications.

The company reserves the right to make changes in specifications and models as design improvements are introduced, without prior notice.
